PROJECTS ON DEEP LEARNING TO HASH

Jan. 2016 - Nov. 2017

PAPER: TRANSITIVE HASHING NETWORK FOR HETEROGENEOUS MULTIMEDIA RETRIEVAL

- Proposed a new cross-modal retrieval scenario where no explicit cross-modal relationship exists between query and database.
- Proposed a Transitive Hashing Network (THN), which transfers knowledge between modalities by heterogeneous relationship learning and between domains by homogeneous distribution alignment. A transitive transfer path is built from query to database.
- Achieved huge accuracy boost (~ 10% on ImageNet-1000 to Yahoo-QA). Wrote the paper under the supervision of my mentor.

PAPER: HASHNET: DEEP LEARNING TO HASH BY CONTINUATION

- Proposed an end-to-end HashNet, the first deep architecture to learn exactly binary codes for image retrieval and compression.
- Enabled back-propagation of deep networks with sign activation function by continuation method, which attacks the ill-posed gradient problem by sequentially optimizing a series of easier networks that converge to the original optimization problem.
- Proposed a weighted likelihood to learn hash codes from data where numbers of similar pairs and dissimilar pairs are imbalanced.
- Implemented HashNet, and reimplemented state-of-the-art methods and wrote the paper under the supervision of my mentor.

PAPER: TRANSFER ADVERSARIAL HASHING FOR HAMMING SPACE RETRIEVAL

June. 2017 - August. 2017

- Proposed Transfer Adversarial Hashing (TAH), the first model that enables Hamming space retrieval across different domains, enabling $O(1)$ search cost by pruning candidates with hash table lookup within Hamming Radius 2.
- Proposed a novel pairwise cross-entropy loss based on t -distribution to concentrate similar images within small Hamming ball.
- Integrated domain-adversarial network for knowledge transfer between domains, enabling hashing for transfer retrieval tasks.
- Constructed new transfer retrieval datasets from the latest VisDA 2017 domain adaptation challenge dataset, implemented TAH and reimplemented state-of-the-art methods, and wrote the paper under the supervision of my mentor.

PAPER: DEEP FOCAL HASHING

- Proposed Deep Focal Hashing (DFH), which achieves state-of-the-art image retrieval performance based on Hamming ranking.
- Extended the Focal Loss (ICCV'17 best student paper) to metric learning with pairwise supervision, which focuses deep hashing models on harder pairs and rarer classes.
- Proposed a Quantization Focal Loss, which focuses deep hashing models on instances more difficult to quantize into hash codes.
- Implemented DFH, reimplemented state-of-the-art methods and wrote the paper under the supervision of my mentor.

PROJECTS ON DOMAIN ADAPTATION

Sept. 2016 - June. 2018

PAPER: MULTI-ADVERSARIAL DOMAIN ADAPTATION

- Proposed to use the probability over classes as the weighting strategy for training multiple adversaries in domain adaptation.
- Implemented Multi-Adversarial Domain Adaptation (MADA), designed and ran experiments and helped to proofread the paper.

PAPER: PARTIAL TRANSFER LEARNING WITH SELECTIVE ADVERSARIAL NETWORKS

- Proposed a new Partial Transfer Learning problem, which focuses on transferring knowledge from big domains to small domains.
- Proposed a Selective Adversarial Network (SAN) with multiple adversarial networks and a weighing mechanism at both instance-level and class-level, which encourages positive transfer of relevant classes and circumvents negative transfer of outlier classes.
- Achieved huge accuracy boost ($\sim 10\%$ on ImageNet-1000 to Caltech-256). Wrote the paper under the supervision of my mentor.

PAPER: PARTIAL ADVERSARIAL DOMAIN ADAPTATION

- Proposed Partial Adversarial Domain Adaptation (PADA) with a carefully designed class-level weighing mechanism, which encourages positive transfer of relevant classes and circumvents the influence of negative transfer of outlier classes.
- Achieved huge accuracy boost both on dataset with large domain gap (Office-Home) and large-scale dataset (ImageNet-Caltech). Wrote the paper under the supervision of my mentor.

PAPER: LEARNING TRANSFERABLE FEATURES WITH VERY DEEP ADAPTATION NETWORKS

- The first work with my mentor. Identified the performance bottleneck caused by poor initialization, and proposed a progressive strategy to stabilize training across the classification loss and the adaptation loss, achieving significant accuracy improvement.
- Implemented the proposed Very Deep Adaptation Network (VDAN) and reimplemented state-of-the-art methods in Caffe.
- Designed a series of in-depth experiments for different datasets, methods, and configurations, ran and analyze all experiments.

PAPER: CONDITIONAL ADVERSARIAL DOMAIN ADAPTATION

- Implemented the proposed Randomized Multilinear Adversarial Networks (RMAN) in both Caffe and Pytorch frameworks.
- Designed and ran experiments and helped proofread the paper.

PAPER: LEARNING MULTIPLE TASKS WITH MULTILINEAR RELATIONSHIP NETWORKS

- Implemented in Pytorch the Multilinear Relationship Networks (MRN), the pioneering model that captures tensor relationships.
- Proposed an efficient strategy by Tensor Decomposition to dramatically speedup computation and prevent numerical instability.
- Designed a series of experiments for new datasets and comparison methods, ran all experiments and helped proofread the paper.

U.S.A

Mentor: Olga Troyanskaya

PROJECT: ALGORITHMS USING DEEP LEARNING FOR NONCODING VARIANTS RECOGNITION

July. 2016 - August. 2016

- Designed new architecture with multiple classifiers build on each convolutional layers to exploit low level features and solved the gradient vanishing problem of the original network.
- Considering the relation of different chromatin features (labels), I improved the classifying layer with low rank technical.
- The new architecture outperformed existing methods under standard evaluation criteria such as AUC of PR Curve and ROC Curve.

Mentor: Qixing Huang

PAPER: 3D OBJECT CLASSIFICATION VIA SPHERICAL PROJECTIONS

Feb. 2017 - May. 2017

- Proposed a spherical representation leveraging depth variation and contour information for 3D objects.
- Developed deep neural networks composing of two parts for depth and contour representation respectively to classify 3D objects.
- Implemented Spherical Projection in caffe framework and carefully designed experiments to compare our method with state of the art methods under standard evaluation criteria on large scale 3D Recognition Dataset.
- Wrote the first version of the paper under the supervision of my mentor.

Honors & Awards

2015	National Scholarship , Tsinghua University	China
2015	Best Project Award , Course of Architecture of Computer and Network	China
2016	Qualcomm Scholarship , Tsinghua University	China
2018	Rank 3 in Visual Domain Adaptation Challenge (VisDA-2018) , ECCV2018 Workshop Challenge (http://ai.bu.edu/visda-2018)	Munich, Germany

Skills

Programming	Python, C/C++, Matlab, Lua, Bash, JAVA, LaTeX, Haskell
Framework	Torch with Lua, Caffe with C++, PyTorch with Python
Languages	English, Chinese
